What is claimed is:

- 1. A resorbable thin membrane comprising a substantially uniform composition comprising a polymer, the polymer being capable of resorbing into the mammalian body within a period less than about 24 months from an initial implantation of the membrane into the mammalian body, the polymer having a biased molecular orientation in the membrane that is biased to at least one axis and having a viscosity property that is greater than about 1 g/dL, the membrane having a first substantially-smooth surface and a second substantially-smooth surface, and the membrane being non-porous, and the membrane having a thickness of about 0.001 mm to about 0.300 mm as measured between the first substantially-smooth surface and the second substantially-smooth surface.
- The membrane of claim 1, wherein the polymer comprises a substantially amorphous polymer.
 - 3. The membrane of claim 1 wherein the polymer comprises a polylactide.
- 4. The membrane of claim 1 wherein the polylactide comprises a copolymer of L-lactide and D,L-lactide.
 - 5. The membrane of claim 1 wherein the polymer comprises a copolymer of lactide and epsilon caprolactone.
 - 6. The membrane of claim 3 wherein the molecular orientation of the polymer is biased toward one axis.
- 7. The membrane of claim 3 wherein the molecular orientation of the polymer is biased toward two axes.

- 8. The membrane of claim 3 being about 0.010 mm to about 0.100 mm thick.
- 9. The membrane of claim 3 being about 0.015 mm to about 0.025 mm thick.
- 5 10. The membrane of claim 3 being about 0.020 mm thick.
 - 11. The membrane of claim 3 wherein the membrane has a glass transition temperature, and a thickness of the membrane increases by at least 5 times when the membrane is brought to its glass transition temperature.

10

- 12. The membrane of claim 3 wherein the membrane has a glass transition temperature, and a thickness of the membrane increases by at least 10 times when the membrane is brought to its glass transition temperature.
- 13. The membrane of claim 3 being impregnated with an additive selected from the group consisting of a chemotactic substance for influencing cell-migration, an inhibitory substance for influencing cell-migration, a mitogenic growth factor for influencing cell proliferation and a growth factor for influencing cell differentiation.
- 20 14. The membrane of claim 3 being contained in a sealed sterile packaging.
 - 15. The membrane of claim 3 further having at least one thick portion, each thick portion has a length equal to or shorter than the longest length of the membrane, a width greater than about 0.5 mm, and a thickness greater than about 2 times a thickness of a central area of the membrane.
 - 16. The membrane of claim 15 wherein the thick portion protrudes from both of the two substantially-smooth surfaces and forms at least a segment of an edge of the membrane.
- The membrane of claim 15 wherein a first thick portion forms at least a segment of a first edge of the membrane, and a second thick portion forms at least a segment of a second

edge of the membrane.

5

15

- 18. The membrane of claim 15 wherein a thickness of the membrane increases more than 2 times when the membrane is brought to its glass transition temperature
- 19. The membrane of claim 17 further comprising a plurality of holes disposed along the thick portion.
- 20. The membrane of claim 3 further comprising a plurality of holes disposed along an edge of the membrane.
 - 21. The membrane of claim 3 having a viscosity property greater than about 2 g/dL.
 - 22. The membrane of claim 3 having a viscosity property of about 3 g/dL.
 - 23. The membrane of claim 3 having a non-uniform shrinking characteristic.
 - 24. The membrane of claim 3 having a directional shrinking characteristic.
- 25. A resorbable thin membrane comprising a substantially uniform composition of a polymer extruded into a membrane, the membrane being capable of resorbing into the mammalian body within a period less than about 24 months from an initial implantation of the membrane into the mammalian body, the membrane having a viscosity property greater than about 1 g/dL, and further having a first substantially-smooth surface and a second substantially-smooth surface and being about 0.010 mm to about 0.030 mm thick as measured between the first substantially-smooth surface and the second substantially-smooth surface.
 - 26. The membrane of claim 25, wherein the polymer comprises a substantially amorphous polymer.
 - 27. The membrane of claim 25 further comprising at least one thick portion, the at least

one thick portion having a length equal to or shorter than a longest length of the membrane, a width greater than about 0.5 mm, and a thickness greater than about 2 times the thickness of the membrane at a region other than the at least one thick portion.

- 5 28. The membrane of claim 27 wherein the thick portion protrudes from both of the two substantially-smooth surfaces and forms at least a segment of an edge of the membrane.
 - 29. The membrane of claim 27 wherein a first thick portion forms at least a segment of a first edge of the membrane, and a second thick portion forms at least a segment of a second edge of the membrane.
 - 30. The membrane of claim 27 wherein the thick portion is effective to provide rigidity to the membrane.
- 15 31. The membrane of claim 27 further comprising a plurality of holes disposed along the thick portion.
 - 32. The membrane of claim 25 wherein the membrane is non-porous and comprises polylactide.

20

25

30

- 33. A resorbable thin membrane comprising:
- a first substantially-smooth surface and a second substantially-smooth surface, wherein a thickness between the first and the second substantially-smooth surface is about 0.01 mm to about 0.300 mm; and
- at least one thick portion, the at least one thick portion having a length less than or equal to a longest length of the membrane, a width greater than about 0.5 mm, and a thickness greater than about 2 times the thickness of the membrane at a region other than the at least one thick portion.
- 34. The membrane of claim 33 wherein the thick portion protrudes from both of the two substantially-smooth surfaces and forms at least a segment of an edge of the membrane.

- 35. The membrane of claim 33 comprising a first thick portion forming at least a segment of a first edge of the membrane, and a second thick portion forming at least a segment of a second edge of the membrane.
- 36. The membrane of claim 33 further comprising a plurality of holes disposed along the thick portion.
- 37. The membrane of claim 33, wherein the at least one thick portion comprises a plurality of thick portions and the membrane is constructed from a substantially amorphous polymer.
 - 38. The membrane of claim 37 wherein the polymer comprises a polylactide.

5

25

- 15 39. The membrane of claim 38 wherein the polymer comprises a copolymer of a L-lactide and D,L-lactide.
 - 40. The membrane of claim 37 wherein the polymer comprises a caprolactone.
- The membrane of claim 37 wherein the polymer has a biased molecular orientation toward one axis.
 - 42. The membrane of claim 37 wherein the polymer has a biased molecular orientation toward two axes.
 - 43. The membrane of claim 37 being about 0.015 mm to about 0.025 mm thick.
 - 44. The membrane of claim 37 wherein the membrane has a glass transition temperature, and a thickness of the membrane increases by at least 5 times when the membrane is brought to its glass transition temperature.

- 45. The membrane of claim 37 wherein the membrane has a glass transition temperature, and a thickness of the membrane increases by at least 10 times when the membrane is brought to its glass transition temperature.
- 5 46. The membrane of claim 37 wherein the membrane is impermeable to a fluid.
 - 47. The membrane of claim 37 further comprising an additive impregnated in the membrane, the additive being selected from the group consisting of a chemotactic substance for influencing cell-migration, an inhibitory substance for influencing cell-migration, a mitogenic growth factor for influencing cell proliferation and a growth factor for influencing cell differentiation.
 - 48. The membrane of claim 37 being contained in a sealed sterile packaging.

10

25

30

- 15 49. The membrane of claim 37 having a viscosity property greater than about 1 g/dL.
 - 50. The membrane of claim 37 having a viscosity property greater than about 2 g/dL.
- 51. A resorbable scar-tissue reduction micro-membrane for attenuating a formation of post-surgical scar tissue between a healing post-surgical site and adjacent surrounding tissue following an in vivo surgical procedure on the post-surgical site, the implant having a pre-implant configuration, which is defined as a configuration of the implant immediately before the implant is formed between the post-surgical site and the adjacent surrounding tissue, the implant comprising:
 - a substantially planar membrane of resorbable polymer base material having a first substantially-smooth side and a second substantially-smooth side, the substantially planar membrane of resorbable polymer base material comprising a single layer of resorbable polymer base material between the first substantially-smooth side and the second substantially-smooth side, the single layer of resorbable polymer base material having a substantially uniform composition;

wherein a thickness of the single layer of resorbable polymer base material, measured

between the first substantially-smooth side and the second substantially-smooth side, is between about 10 microns and about 300 microns;

wherein the single layer of resorbable polymer base material is non-porous; and wherein the single layer of resorbable polymer base material consists essentially of a material selected from the group consisting of:

a lactide polymer; and

5

10

a copolymer of two or more cyclic esters; and

wherein the single layer of resorbable polymer base material is adapted to maintain a smooth-surfaced barrier between the healing post-surgical site and the adjacent surrounding tissue for a relatively extended period of time sufficient to attenuate or eliminate any formation of scar tissue between the post-surgical site and the adjacent surrounding tissue, and is adapted to be resorbed into the mammalian body within a period of approximately 24 months or less from an initial implantation of the implant into the mammalian body.

15 52. The resorbable scar-tissue reduction micro-membrane as set forth in claim 51, wherein the copolymer of two or more cyclic esters comprises lactide and epsilon caprolactone.
